```
protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F-DP domain. DP proteins can be medulated to alter plant cell, organ or tissue shape, and particularly to alter cell proliferation characteristic such as to alter plant cell, organ or tissue size
encodes a E2F-dimerisation partner (DP) protein. The

encoding a cell proliferation related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body of the specification as EPO data.
                                                                                                                                                                                                                     1020

The present invention describes rice endosperm specific expression sequence labels (expressed sequence tag (EST)) comprising the 48 cDNA sequences, given in SEQ ID NO:1 to 48. The expression sequence labels can be combined in a gene chip using the microarray technique. The expression sequence labels are useful for DNA sequence determination of constitutive rice endosperm cDNA library, removing redundant sequences, and searching interconnection network data bases. The chip can be used for gene cloning, early prediction of hybrid vigour, safety detection of transgenic agricultural product, screening new-type herbicides and pesticides.

Increased collected from increased tolerance to abiotic stress, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to heat, increased colerance to heat, increased colerance to permination in heat, increased tolerance to heat, increased tolerance to germination in heat, increased tolerance to germination in heat, increased tolerance to conditions, increased tolerance to increased tolerance to multiple fungal pathogens, increased tolerance to multiple fungal pathogens, increased resistance to glyphosate, increased sensitivity to ABA, reduced sensitivity to ABC, altered sugar sensing, increased tolerance to sugars sensing, increased tolerance to sugars, altered carbon/nitrogen sensing, altered carbon/nitrogen sensing, altered track about meristem development, altered branching pattern, altered stem morphology, altered vascular tissue structure, reduced captering, altered shoot meristem development, altered branching pattern, altered stem morphology, altered vascular tissue structure, reduced aptered trichome structure altered coldevelopment, altered shade aptered trichome structure altered coldevelopment, altered sendered shade captered trichome structure altered coldevelopment, altered sendered captered trichome structure altered coldevelopment, altered sendered capteriation, altered sendered captered trichome structure, altered captered trichome attered trichome development, altered sendered trichome altered captered captered captered sendered captered captered captered captered sendered captered sendered captered c
                                                                                                                                            Plant; transcription factor; transgenic plant; abiotic stress tolerance; sembicis stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low hosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                              Transcription factor G2981 orthologous sequence, SEQ ID 1626.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        recombinant polynucleotide encoding transcription factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 1626; 510pp; English.

AAF80146-50 represent DNA fragments of a gene encoding a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and particularly organ or tissue size
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TTCAACGITCTCATTGCACTTCGTGTTATTGCAAAAGAAAAAAAGGAGATACGGTGGATG 120
                                                                           New isolated, enriched, cell free and/or recombinant nucleic acid useful for e.g. altering cell proliferation characteristic such as to alter plant cell, organ or tissue size.

                                                                                                                                                                                                                                    AAF80146-50 represent DNA fragments of a gene encoding a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblactoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblactoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and particularly organ or tissue size

We recombinant polyvuoleotide encoding transcription factor
properties useful for producing transgenic plants with advantageous
properties compared to a reference plant.

Compared to 1319; 510pp; English.

The present invention relates to novel plant transcription factor
compared to the used to produce transgenic plants, which oversapess
(III) where the transgenic plant or which type plant increased tolerance to cold,
increased tolerance to sometic stress, increased tolerance to cold,
increased tolerance to sometic stress, increased tolerance to cold,
increased tolerance to sometic stress, increased tolerance to cold,
increased tolerance to sometic stress, increased tolerance to cold,
increased tolerance to low nitrogen conditions, increased tolerance to cold,
increased tolerance to low nitrogen conditions, increased tolerance to
grammation in heat, increased tolerance to disease including
increased tolerance to low nitrogen conditions, increased tolerance to
grammation in heat, increased tolerance to disease including
increased tolerance to low nitrogen conditions, increased tolerance to
grammation with the timerages enablishing pathogens, increased tolerance to
low phosphate conditions, increased tolerance to
low phosphate conditions, increased tolerance to
low phosphate submonfulity to ABA, reduced sensity, increased tolerance to
low phosphate conditions, altered tolerance to discarce
to sugars, altered flower terred track development, altered send track development, altered send development, altered tolerance tolerance, altered tolerance, altered

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (MD061534-AD06379B). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to cold,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                             TTCAGATGACTCGAAGTTTGCCCCATTTCGAGTTCAATGGTGCACCATTCACATTGCATGA

fungal disease and particularly Erysiphe, Fusarium and Botrytis, increased tolerance to multiple fungal pathogens, increased resistance to glyphosate, increased sensitivity to ABA, reduced sensitivity to ABA, increased sensitivity to ABA, increased sensitivity to ACC, altered sugar sensing, increased tolerance to sugars, altered carbon/futrogen sensing, early flowering, late flowering, altered flower structure, loss of flower determinacy, reduced altered stem morphology, altered development, altered branching pattern, altered stem morphology, altered vascular tissue structure, reduced appical dominance, altered trichome density, altered trichome development, altered trichome structure, altered shade 709 779 CCTCACGCAGTAGTCGAAATCGAGATTTCTGAAGATATGCAACTTGTACACCTCGACTTC 838 Plant; transcription factor; transgenic plant; abiotic stress tolerance; sometic stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development; ds. avoidance, altered seed development, altered seed ripening, altered seed germination, slow growth, fast growth, altered cell differentiation, The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (AD061534-AD063778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to osmotic stress, increased tolerance to cold, increased germination in cold, increased tolerance to heat, increased germination in heat, increased tolerance to freezing conditions, increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant. 650 AGGAAAGCAAGGTGGAAATTGAGATTTCAGATGACTCGAAGTTTGCCCATTTCGAGTTC Reuber TL; Adam LJ, Re Sherman BK; Transcription factor G2981 coding sequence, SEQ ID 611.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠ
```

The invention relates to a novel cell cycle protein (CCP) and the colymucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and anni-CCP antibody is useful for modulating the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle progression is useful for modulating the cell cycle progression in plants. CCP is useful to treat regulating cell cycle progression in plants. CCP is useful to treat and canola. CCP modulating of protein or production of CCP protein forms which have decreased or absorber compounds that bind to or modulating agents in captured care useful as herbicides or plant growth regulators. The polypeptide are useful for modifying cell fate, plant development, collypeptide are useful for modifying cell fate, plant development, collypeptide are useful as herbicides or plant growth regulators. The polyputchectide is useful for modifying cell fate, plant development, collypeptide are useful as herbicides or plant growth regulation, promotion, stimulation or mhancement of cell division, bnA replication, premotion, stimulation and/or development, tuber, fruit, leaf formation, shoot and root initiation and/or development, tuber, fruit, leaf formation, continitiation and/or development, module furction, dwarfism in plants, continitiation and/or development, module furction, dwarfism in plants, containing the plants of the cell cycle of a plant string activity of a protein involved in the cell cycle due to environmental conditions, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, averlopment, endoreduplication in storage cells, storage tienes and/or development, enhance crop yields and attendate e.g. enhance crop yields and attendate of a protein involved in the cell cycle due to convirue cycle organs of plants or its parts. CCP is useful as useful as an immunogen to convint con contraing CCP substrates. The po 131 AATGCGGTCCAAAGGAAGGGGGCTGTTGACCCGGATAAAGATAGGAAGAAGAAGAAGGAGAAGCT 190 86 ACTCCAGTCAGAAGGAAATTGATTGTTGATGATTGATTTGGATTGGATCAGAGAAA 145 Cell cycle protein; CCP; ss; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; occurring CCP substrates. The polynucleotide is useful for expressing CCI protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence encodes a CCP protein of the New cell cycle protein and nucleic acid molecule encoding it useful fregulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators. 21; Gaps Length 1114; Sequence 1114 BP; 378 A; 197 C; 243 G; 296 T; 0 U; 0 Other; .; Z Indels De Veylder L, Acosta JAT, Magyar Score 153.6; DB 6; Pred. The invention relates to a novel cell cycle protein (CCP) and the polymucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample A CCP modulator is useful for modulating the cell cycle protein to read and polypeptide molecules are useful as modulating agents in neits, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP mucles of acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or protein or production of CCP protein forms which have decreased or protein or production of CCP protein forms which have decreased or protein or production of CCP protein forms which have decreased or polymorleotide is useful for modifying cell fate, plant development, of polymorleotide is useful for modifying cell fate, plant development, to polymorleotide is useful for modifying cell fate, plant development, to stimulation or enhancement of cell division, blant plants, stimulation and/or development, tuber, fruit, leaf formation, shoot and root initiation and/or development, module function, development, endicated acceptance or resistance to stress. CCP, the polymorleotide and the anti-CCP antibody are useful in agriculture to modulate the continuous and attendate or activity, of a protein involved in the cell side to protein land, heat, drought, salt stress, or biotic stress such as cold, mutrient deprivation, heat, drought, salt stress, or biotic stress such as environmental conditions, including abiotic stress such as infunded acceptage cells, storage tells, corage organs of plant architecture, plant quality traits, plant reproduction and see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  220

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to increasing the cell number of specific cell types, specific tissues or specific organs in a plant comprises modulating the expression and/or the activity in the specific cell types, specific tissues or specific organs of the plant E2F transcription factor. The E2F transcription factor or its homologue, derivative or fargment, is useful for prolonging the period of cell division in certain cells and tissues, for increasing the period of cell division in certain cells and tissues, for increasing the period of cell division in certain cells and tissues, for obtaining seedlings with enhancing expedings, for obtaining plants thaving more cells in a particular tissue, for obtaining plants having more cells in a particular tissue, for obtaining plants having more cells in a particular tissue, for obtaining plants having more cells in a particular tissue, for obtaining plants having the cells to re-enter the cell cycle, for overriding the cell differentiation signals, or for altering cell shape.

The present sequence represents the dimerisation partner encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plants comprises

expression or activity of an E2F and DP gene or polypeptide. Also described: (1) a transgenic plant cell overexpressing an E2F and described: (1) a transgenic plant cell overexpressing an E2F and gene, or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP gene or an E2F and DP are plant, or a part of the plant, comprising the cells described above; (3) a progeny of the plant described above. The method is useful in modulating plant cell cycle proteins by modifying the expression or activity of an E2F and DP gene or polypeptide. The present sequence encodes Arabidopsis thaliana DP, which
                                                                                                                                                                                                    Modulating endoreduplication in a plant, or a part of the plant, comprises modifying the expression or activity of an E2Fa and DPa gene or
                                                                                                                                                                                                                                                                                                       The present invention describes a method for modulating endoreduplication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1274 BP; 420 A; 228 C; 271 G; 355 T; 0 U; 0 Other;

The present invention relates to novel plant transcription factor proteins (1) and nucleotide sequences (11) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises can altered trait selected from increased tolerance to ablotic stress, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to heat, increased commination in heat, increased tolerance to heat, increased tolerance to low phosphate conditions, increased tolerance to low phosphate conditions, increased tolerance to low phosphate conditions, increased tolerance to low phosphate conditions, increased tolerance to multiple fungal pathogens, increased resistance to phybosate, increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ACC, altered sugar sensing, increased tolerance to sugars, altered flower structure, loss of flower determinacy, reduced fortility, altered carbon/nitrogen sensing, altered branching pattern, altered stem morphology, altered vascular tissue structure, reduced epical dominance, altered trichome density, altered trichome development,
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Plant; transcription factor; transgenic plant; abiotic stress tolerance; semotic stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             altered trichome structure, altered root development, altered shade avoidance, altered seed development, altered seed ripening, altered seed germination, slow growth, fast growth, altered cell differentiation,

DNA fragment encoding a wheat E2F-dimerisation partner (DP) protein.

222222222222222**8** 

```
altered cell proliferation, altered cell expansion, altered phase change, altered senescence, abnormal embryo development, altered programmed cell ceath, lethality when overexpressed, altered necrosis patterns, increased plants increased blomass, large seedlings, dwarfed plants, dark green leaves, change in leaf shape, increased leaf size and mass, light green or gray leaves, glossy leaves, altered abaxial/adaxial polarity, altered seed coloration, altered seed size, altered seed shape, large seed, increased leaf fatty acids, altered seed oil content, altered seed protein content, altered seed protein content, increased anthocyanin levels, and altered leaf prenyl lipid content, increased anthocyanin levels, and content not form part of the printed specification, but was obtained in clectronic format directly from WIPO at the wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TTAGGAACAAGAAGGCACTCCTCCAGGAAATCGAAAAACAGTTTGATGATCTCCAAAACA 566

AAPB0146-50 represent DNA fragments of a gene encoding a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and particularly organ or tissue size
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

Mot!; An unidirectional CDNA library generated from [Apical meristem and tissues surrounding of mature plants! cDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
the Human Genter, University of Tokyo Institute of Medical
Science; plant material and RNA prepared at Texas A & W University,
sequencing done in the Laboratory for Genomics and Bioinformatics,
University of Georgia. Sequence ends have been trimmed to exclude
vector and regions below Phred quality 16. Three-prime sequences
are presented as their reverse complement and have been trimmed to
exclude polyA.

The sequences are based on single pass reads.
Life Technologies (a division of Invitrogen) members carried out full-length librairies construction: Temple G. Genoscope members carried out sequencing and annotation: Castel V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Welssenbach J., Salanoubat M. Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /done_lib="potento abiotic stress cDNA library"
/done_lib="potento abiotic stress cDNA library"
/note="Vector: DCNVSport6.1; Site_1: ECORI; Site_2: NotI;
supplier: Solanum tibersoum var. Kennebec plants were
grown from cuttings on a l6hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mm Nacl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 12hr, 1d, 2d, and 4d; rocfe:2hr, 6hr, 12hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; rochs:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and rocts were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and heat-stressed rocts were harvested at 6 hr,
12 hr, 1 d, and 4d. RNA was isolated from all tissues and
equal RNA from each tissue and stress was pooled to
construct the CDNA library. RNA sample."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /tissue_type="abiotic stress treated leaf and root tissue"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length librairies construction: Temple G. Genoscope members carried out sequencing and annotation: Castel V. Aury J.M., Jailon O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salanoubat M. Montation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences): 5 prime and 3 prime are assembled with Phrap.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              710 deagacercircerceacaacerraagecaarraagaarraaagaarraaa

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
